# Database Management Systems

Subject Teacher: Zartasha Baloch

## Joins

#### Lecture # 17 & 18

**Disclaimer:** The material used in this presentation to deliver the lecture i.e., definitions/text and pictures/graphs etc. does not solely belong to the author/presenter. The presenter has gathered this lecture material from various sources on web/textbooks. Following sources are especially acknowledged:

- Connolly, Thomas M., and Carolyn E. Begg. Database systems: a practical approach to design, implementation, and management. Pearson Education, 2005.
- 2. Gorman, Tim, Inger Jorgensen, Melanie Caffrey, and Lex deHaan. Beginning Oracle SQL: For Oracle Database 12c. Apress, 2014.
- 3. Greenberg, Nancy, and Instructor Guide PriyaNathan. "Introduction to Oracle9i: SQL." ORACLE, USA (2001)

#### Objectives

After completing this lesson, you should be able to do the following:

- Write SELECT statements to access data from more than one table using equality and nonequality joins
- View data that generally does not meet a join condition by using outer joins
- Join a table to itself by using a self join

## Obtaining Data from Multiple Tables

#### **EMPLOYEES**

| EMPLOYEE_ID | LAST_NAME | DEPARTMENT_ID |
|-------------|-----------|---------------|
| 100         | King      | 90            |
| 101         | Kochhar   | 90            |
|             |           |               |
| 202         | Fay       | 20            |
| 205         | Higgins   | 110           |
| 206         | Gietz     | 110           |

#### **DEPARTMENTS**

| DEPARTMENT_ID | DEPARTMENT_NAME | LOCATION_ID |
|---------------|-----------------|-------------|
| 10            | Administration  | 1700        |
| 20            | Marketing       | 1800        |
| 50            | Shipping        | 1500        |
| 60            | IT              | 1400        |
| 80            | Sales           | 2500        |
| 90            | Executive       | 1700        |
| 110           | Accounting      | 1700        |
| 190           | Contracting     | 1700        |

| EMPLOYEE_ID | DEPARTMENT_ID | DEPARTMENT_NAME |
|-------------|---------------|-----------------|
| 200         | 10            | Administration  |
| 201         | 20            | Marketing       |
| 202         | 20            | Marketing       |

| 102 | 90  | Executive  |
|-----|-----|------------|
| 205 | 110 | Accounting |
| 206 | 110 | Accounting |

#### Cartesian Products

- ► A Cartesian product is formed when:
  - A join condition is omitted
  - ► A join condition is invalid
  - ▶ All rows in the first table are joined to all rows in the second table
- ▶ To avoid a Cartesian product, always include a valid join condition in a WHERE clause.

## Generating a Cartesian Product

#### EMPLOYEES (20 rows)

| EMPLOYEE_ID | LAST_NAME | DEPARTMENT_ID |
|-------------|-----------|---------------|
| 100         | King      | 90            |
| 101         | Kochhar   | 90            |
|             |           |               |
| 202         | Fay       | 20            |
| 205         | Higgins   | 110           |
| 206         | Gietz     | 110           |

20 rows selected.

#### DEPARTMENTS (8 rows)

| DEPARTMENT_ID | DEPARTMENT_NAME | LOCATION_ID |
|---------------|-----------------|-------------|
| 10            | Administration  | 1700        |
| 20            | Marketing       | 1800        |
| 50            | Shipping        | 1500        |
| 60            | IT              | 1400        |
| 80            | Sales           | 2500        |
| 90            | Executive       | 1700        |
| 110           | Accounting      | 1700        |
| 190           | Contracting     | 1700        |

8 rows selected

Cartesian product: -> 20x8=160 rows

|   | EMPLOYEE_ID | DEPARTMENT_ID | LOCATION_ID |
|---|-------------|---------------|-------------|
|   | 100         | 90            | 1700        |
|   | 101         | 90            | 1700        |
|   | 102         | 90            | 1700        |
| • | 103         | 60            | 1700        |
|   | 104         | 60            | 1700        |
|   | 107         | 60            | 1700        |

. . .

## Types of Joins

## Oracle Proprietary Joins (8*i* and prior):

- Equijoin
- ▶ Non-equijoin
- Outer join
- Self join

## **SQL: 1999 Compliant Joins:**

- Cross joins
- Natural joins
- Using clause
- Full or two sided outer joins
- Arbitrary join conditions for outer joins

### Joining Tables Using Oracle Syntax

Use a join to query data from more than one table.

```
SELECT table1.column, table2.column
FROM table1, table2
WHERE table1.column1 = table2.column2;
```

- ▶ Write the join condition in the WHERE clause.
- Prefix the column name with the table name when the same column name appears in more than one table.

## What is an Equijoin?

#### **EMPLOYEES**

| EMPLOYEE_ID | DEPARTMENT_ID |
|-------------|---------------|
| 200         | 10            |
| 201         | 20            |
| 202         | 20            |
| 124         | 50            |
| 141         | 50            |
| 142         | 50            |
| 143         | 50            |
| 144         | 50            |
| 103         | 60            |
| 104         | 60            |
| 107         | 60            |
| 149         | 80            |
| 174         | 80            |
| 176         | 80            |

#### **DEPARTMENTS**

| DEPARTMENT_ID | DEPARTMENT_NAME |
|---------------|-----------------|
| 10            | Administration  |
| 20            | Marketing       |
| 20            | Marketing       |
| 50            | Shipping        |
| 60            | IT              |
| 60            | IT              |
| 60            | IT              |
| 80            | Sales           |
| 80            | Sales           |
| 80            | Sales           |

## Retrieving Records with Equijoins

```
SELECT employees.employee_id, employees.last_name,
    employees.department_id, departments.department_id,
    departments.location_id

FROM employees, departments
WHERE employees.department_id = departments.department_id;
```

| EMPLOYEE_ID | LAST_NAME | DEPARTMENT_ID | DEPARTMENT_ID | LOCATION_ID |
|-------------|-----------|---------------|---------------|-------------|
| 200         | Whalen    | 10            | 10            | 1700        |
| 201         | Hartstein | 20            | 20            | 1800        |
| 202         | Fay       | 20            | 20            | 1800        |
| 124         | Mourgos   | 50            | 50            | 1500        |
| 141         | Rajs      | 50            | 50            | 1500        |
| 142         | Davies    | 50            | 50            | 1500        |
| 143         | Matos     | 50            | 50            | 1500        |
| 144         | Vargas    | 50            | 50            | 1500        |

. . .

## Additional Search Conditions Using the AND Operator

#### **EMPLOYEES**

#### LAST\_NAME DEPARTMENT ID Whalen 10 Hartstein 20 20 50 Mourgos Rajs 50 50 Davies 50 Matos 50 Vargas Hunold 60 Ernst

#### **DEPARTMENTS**

| 10            | Administration  |
| 20            | Marketing       |
| 20            | Marketing       |
| 50            | Shipping        |
| 60            | [IT             |
| 60            | IT              |

...

### Qualifying Ambiguous Column Names

- Use table prefixes to qualify column names that are in multiple tables.
- ▶ Improve performance by using table prefixes.
- Distinguish columns that have identical names but reside in different tables by using column aliases.

### Using Table Aliases

- Simplify queries by using table aliases.
- Improve performance by using table prefixes.

## Joining More than Two Tables

| EMPLOYEES |               |   | DEPARTMENTS      |             | LOCATI      | ONS                 |
|-----------|---------------|---|------------------|-------------|-------------|---------------------|
| LAST_NAME | DEPARTMENT_ID |   | DEPARTMENT_ID    | LOCATION_ID | LOCATION_ID | CITY                |
| King      | 90            |   | 10               | 1700        | 1400        | Southlake           |
| Kochhar   | 90            |   | 20               | 1800        | 1500        | South San Francisco |
| De Haan   | 90            |   | 50               | 1500        | 1700        | Seattle             |

| Ernst     | 60            |   | 80               | 2500        | 2500        | Oxford              |
| Lorentz   | 60            |   | 90               | 1700        |             |                     |
| Mourgos   | 50            |   | 110              | 1700        |             |                     |
| Rajs      | 50            |   | 190              | 1700        |             |                     |
| Davies    | 50            | ; | 8 rows selected. |             |             |                     |
| Matos     | 50            |   |                  |             |             |                     |
| Vargas    | 50            |   |                  |             |             |                     |
| Zlotkey   | 80            |   |                  |             |             |                     |
| Abel      | 80            |   |                  |             |             |                     |
| Taylor    | 80            |   |                  |             |             |                     |

20 rows selected.

To join *n* tables together, you need a minimum of n-1 join conditions. For example, to join three tables, a minimum of two joins is required.

## Non-Equijoins

#### **EMPLOYEES**

| LAST_NAME | SALARY |
|-----------|--------|
| King      | 24000  |
| Kochhar   | 17000  |
| De Haan   | 17000  |
| Hunold    | 9000   |
| Ernst     | 6000   |
| Lorentz   | 4200   |
| Mourgos   | 5800   |
| Rajs      | 3500   |
| Davies    | 3100   |
| Matos     | 2600   |
| Vargas    | 2500   |
| Zlotkey   | 10500  |
| Abel      | 11000  |
| Taylor    | 8600   |

. . .

20 rows selected.

#### JOB GRADES

| GRA | LOWEST_SAL | HIGHEST_SAL |
|-----|------------|-------------|
| А   | 1000       | 2999        |
| В   | 3000       | 5999        |
| С   | 6000       | 9999        |
| D   | 10000      | 14999       |
| E   | 15000      | 24999       |
| F   | 25000      | 40000       |

Salary in the EMPLOYEES table must be between lowest salary and highest salary in the JOB\_GRADES table.

## Retrieving Records with Non-Equijoins

```
SELECT e.last_name, e.salary, j.grade_level
FROM employees e, job_grades j
WHERE e.salary
BETWEEN j.lowest_sal AND j.highest_sal;
```

| LAST_NAME | SALARY | GRA |
|-----------|--------|-----|
| Matos     | 2600   | А   |
| Vargas    | 2500   | А   |
| Lorentz   | 4200   | В   |
| Mourgos   | 5800   | В   |
| Rajs      | 3500   | В   |
| Davies    | 3100   | В   |
| Whalen    | 4400   | В   |
| Hunold    | 9000   | С   |
| Ernst     | 6000   | С   |

- - -

#### Outer Joins

#### **DEPARTMENTS**

| DEPARTMENT_NAME | DEPARTMENT_ID |
|-----------------|---------------|
| Administration  | 10            |
| Marketing       | 20            |
| Shipping        | 50            |
| IT              | 60            |
| Sales           | 80            |
| Executive       | 90            |
| Accounting      | 110           |
| Contracting     | 190           |

8 rows selected.

#### **EMPLOYEES**

| DEPARTMENT_ID | LAST_NAME |
|---------------|-----------|
| 90            | King      |
| 90            | Kochhar   |
| 90            | De Haan   |
| 60            | Hunold    |
| 60            | Ernst     |
| 60            | Lorentz   |
| 50            | Mourgos   |
| 50            | Rajs      |
| 50            | Davies    |
| 50            | Matos     |
| 50            | Vargas    |
| 80            | Zlotkey   |

- - -

20 rows selected.

There are no employees in department 190.

#### Outer Joins Syntax

- You use an outer join to also see rows that do not meet the join condition.
- ▶ The Outer join operator is the plus sign (+).

```
SELECT table1.column, table2.column
FROM table1, table2
WHERE table1.column(+) = table2.column;
```

```
SELECT table1.column, table2.column
FROM table1, table2
WHERE table1.column = table2.column(+);
```

## Using Outer Joins

```
SELECT e.last_name, e.department_id, d.department_name
FROM
      employees e, departments d
      e.department id(+) = d.department id ;
WHERE
```

| LAST_NAME | DEPARTMENT_ID | DEPARTMENT_NAME |  |
|-----------|---------------|-----------------|--|
| Whalen    | 10            | Administration  |  |
| Hartstein | 20            | Marketing       |  |
| Fay       | 20            | Marketing       |  |
| Mourgos   | 50            | Shipping        |  |
| Rajs      | 50            | Shipping        |  |
| Davies    | 50            | Shipping        |  |
| Matos     | 50            | Shipping        |  |
|           |               |                 |  |
| 51        | 440           |                 |  |

| Gietz | 110 | Accounting  |
|-------|-----|-------------|
|       |     | Contracting |

#### Self Joins

| EMPLOYEES (W | ORKER) |
|--------------|--------|
|--------------|--------|

#### **EMPLOYEES** (MANAGER)

| LAST_NAME | MANAGER_ID                                |
|-----------|---|
| King      |   |
| Kochhar   | 100                                       |
| De Haan   | 100                                       |
| Hunold    | 102                                       |
| Ernst     | 103                                       |
| Lorentz   | 103                                       |
| Mourgos   | 100                                       |
|           | King Kochhar De Haan Hunold Ernst Lorentz |

**EMPLOYEE ID** LAST NAME 100 King 101 Kochhar 102 De Haan 103 Hunold 104 Ernst 107 Lorentz 124 Mourgos

MANAGER ID in the WORKER table is equal to EMPLOYEE ID in the MANAGER table.

## Joining a Table to Itself

| WORKER.LAST_NAME  'WORKSFOR'  MANAGER.LAST_NAME |
|---|
| ochhar works for King                           |
| e Haan works for King                           |
| 1ourgos works for King                          |
| lotkey works for King                           |
| artstein works for King                         |

#### Joining Tables Using SQL: 1999 Syntax

Use a join to query data from more than one table.

```
SELECT table1.column, table2.column
FROM table1
[CROSS JOIN table2] |
[NATURAL JOIN table2] |
[JOIN table2 USING (column_name)] |
[JOIN table2
ON(table1.column_name = table2.column_name)] |
[LEFT|RIGHT|FULL OUTER JOIN table2
ON (table1.column_name = table2.column_name)];
```

## Creating Cross Joins

- ► The CROSS JOIN clause produces the cross-product of two tables.
- ► This is the same as a Cartesian product between the two tables.

```
SELECT last_name, department_name
FROM employees
CROSS JOIN departments ;
```

| DEPARTMENT_NAME |
|-----------------|
| Administration  |
| Administration  |
| Administration  |
| Administration  |
|                 |

---

## Creating Natural Joins

- ► The NATURAL JOIN clause is based on all columns in the two tables that have the same name.
- It selects rows from the two tables that have equal values in all matched columns.
- If the columns having the same names have different data types, an error is returned.

## Retrieving Records with Natural Joins

| DEPARTMENT_ID | DEPARTMENT_NAME | LOCATION_ID | CITY                |
|---------------|-----------------|-------------|---------------------|
| 60            | IT              | 1400        | Southlake           |
| 50            | Shipping        | 1500        | South San Francisco |
| 10            | Administration  | 1700        | Seattle             |
| 90            | Executive       | 1700        | Seattle             |
| 110           | Accounting      | 1700        | Seattle             |
| 190           | Contracting     | 1700        | Seattle             |
| 20            | Marketing       | 1800        | Toronto             |
| 80            | Sales           | 2500        | Oxford              |

#### Creating Joins with the USING Clause

- If several columns have the same names but the data types do not match, the NATURAL JOIN clause can be modified with the USING clause to specify the columns that should be used for an equijoin.
- Use the USING clause to match only one column when more than one column matches.
- Do not use a table name or alias in the referenced columns.
- ▶ The NATURAL JOIN and USING clauses are mutually exclusive.

## Retrieving Records with the USING Clause

```
SELECT e.employee_id, e.last_name, d.location_id
FROM employees e JOIN departments d
USING (department_id) ;
```

| EMPLOYEE_ID | LAST_NAME | LOCATION_ID |
|-------------|-----------|-------------|
| 200         | Whalen    | 1700        |
| 201         | Hartstein | 1800        |
| 202         | Fay       | 1800        |
| 124         | Mourgos   | 1500        |
| 141         | Rajs      | 1500        |
| 142         | Davies    | 1500        |
| 143         | Matos     | 1500        |
| 144         | Vargas    | 1500        |
| 103         | Hunold    | 1400        |

- - -

#### Creating Joins with the ON Clause

- ▶ The join condition for the natural join is basically an equijoin of all columns with the same name.
- ▶ To specify arbitrary conditions or specify columns to join, the ON clause is used.
- ▶ The join condition is separated from other search conditions.
- ▶ The ON clause makes code easy to understand.

## Retrieving Records with the ON Clause

| EMPLOYEE_ID | LAST_NAME | DEPARTMENT_ID | DEPARTMENT_ID | LOCATION_ID |
|-------------|-----------|---------------|---------------|-------------|
| 200         | Whalen    | 10            | 10            | 1700        |
| 201         | Hartstein | 20            | 20            | 1800        |
| 202         | Fay       | 20            | 20            | 1800        |
| 124         | Mourgos   | 50            | 50            | 1500        |
| 141         | Rajs      | 50            | 50            | 1500        |
| 142         | Davies    | 50            | 50            | 1500        |
| 143         | Matos     | 50            | 50            | 1500        |

. . .

## Creating Three-Way Joins with the ON Clause

```
SELECT employee_id, city, department_name
FROM employees e

JOIN departments d
ON d.department_id = e.department_id
JOIN locations l
ON d.location_id = l.location_id;
```

| EMPLOYEE_ID | CITY                | DEPARTMENT_NAME |
|-------------|---------------------|-----------------|
| 103         | Southlake           | IT              |
| 104         | Southlake           | IT              |
| 107         | Southlake           | IT              |
| 124         | South San Francisco | Shipping        |
| 141         | South San Francisco | Shipping        |
| 142         | South San Francisco | Shipping        |
| 143         | South San Francisco | Shipping        |
| 144         | South San Francisco | Shipping        |

#### INNER Versus OUTER Joins

- ▶ In SQL: 1999, the join of two tables returning only matched rows is an inner join.
- A join between two tables that returns the results of the inner join as well as unmatched rows left (or right) tables is a left (or right) outer join.
- A join between two tables that returns the results of an inner join as well as the results of a left and right join is a full outer join.

#### LEFT OUTER JOIN

```
SELECT e.last_name, e.department_id, d.department_name
FROM employees e
LEFT OUTER JOIN departments d
ON (e.department_id = d.department_id);
```

| LAST_NAME | DEPARTMENT_ID | DEPARTMENT_NAME |
|-----------|---------------|-----------------|
| Whalen    | 10            | Administration  |
| Fay       | 20            | Marketing       |
| Hartstein | 20            | Marketing       |
|           |               |                 |
| De Haan   | 90            | Executive       |
| Kochhar   | 90            | Executive       |
| King      | 90            | Executive       |
| Gietz     | 110           | Accounting      |
| Higgins   | 110           | Accounting      |
| Grant     |               |                 |

#### RIGHT OUTER JOIN

```
SELECT e.last_name, e.department_id, d.department_name
FROM employees e
RIGHT OUTER JOIN departments d
ON (e.department_id = d.department_id);
```

| LAST_NAME | DEPARTMENT_ID | DEPARTMENT_NAME |
|-----------|---------------|-----------------|
| King      | 90            | Executive       |
| Kochhar   | 90            | Executive       |

#### - - -

| Whalen                  | 10 Administration |  |
|-------------------------|-------------------|--|
| Hartstein               | 20 Marketing      |  |
| Fay<br>Higgins<br>Gietz | 20 Marketing      |  |
| Higgins                 | 110 Accounting    |  |
| Gietz                   | 110 Accounting    |  |
|                         | Contracting       |  |

#### FULL OUTER JOIN

```
SELECT e.last_name, e.department_id, d.department_name
FROM employees e

FULL OUTER JOIN departments d
ON (e.department_id = d.department_id);
```

| LAST_NAME | DEPARTMENT_ID | DEPARTMENT_NAME |
|-----------|---------------|-----------------|
| Whalen    | 10            | Administration  |
| Fay       | 20            | Marketing       |
|           |               |                 |
| De Haan   | 90            | Executive       |
| Kochhar   | 90            | Executive       |
| King      | 90            | Executive       |
| Gietz     | 110           | Accounting      |
| Higgins   | 110           | Accounting      |
| Grant     |               |                 |
|           |               | Contracting     |

#### Additional Conditions

| EMPLOYEE_ID | LAST_NAME | DEPARTMENT_ID | DEPARTMENT_ID | LOCATION_ID |
|-------------|-----------|---------------|---------------|-------------|
| 174         | Abel      | 80            | 80            | 2500        |
| 176         | Taylor    | 80            | 80            | 2500        |

### Summary

In this lesson, you should have learned how to use joins to display data from multiple tables in:

- Oracle proprietary syntax for versions 8i and earlier
- ▶ SQL: 1999 compliant syntax for version 9*i*
